

Open Sided Aluminum Party Marquee Tent Specified for Summer Beach Club Service

Our Product Introduction

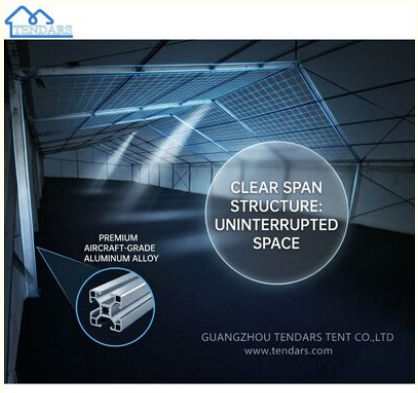

Basic Information

- Place of Origin: Guangdong, China
- Brand Name: Tendars
- Certification: CE, ISO 9001, EN 13782, DIN 4102 B1 fabric
- Model Number: TD-PMT-B2-05
- Minimum Order Quantity: 1 set
- Price: USD 25 - 95 per square meter
- Packaging Details: Frame in bundles by assembly order, fabric folded with interleaving, fittings in labelled crates
- Delivery Time: 15-25 working days after drawing confirmation
- Payment Terms: T/T 30% deposit, balance before shipment; L/C at sight
- Supply Ability: 12000 square meters per month

Product Specification

- Frame Material: Hard-pressed Extruded Aluminum 6061/T6
- Frame Profile: 64 / 82 / 100 / 120 Mm Series By Span
- Roof Fabric: 650-850 G/sqm Double PVC-coated Polyester
- Side Wall: PVC, Clear PVC, Glass Panel, Mesh, ABS Hard Wall
- Wind Load: Engineered Configuration With Written Operating Limits
- Snow Load: Steeper Pitch And Reduced Purlin Spacing Options
- Fire Retardant: DIN 4102 B1 / EN 13501 B-s1,d0 On Request
- Application: Summer Beach Club Service
- Warranty: 5 Years Frame, 2 Years Fabric
- Service: Shop Drawings, Supervisor Installation, Lifetime Spares
- Highlight: **Open Sided Aluminum Party Marquee Tent**,

Product Description

A beach club does not want a room. It wants shade, airflow and a roof that keeps the sun off without blocking the sea. An open sided marquee delivers exactly that: solid cover overhead, no walls on the view side, and a structure that lets the afternoon breeze pass through instead of trapping heat under the fabric.

Open structures carry different loads than closed ones. With no walls, wind passes over and under the roof, which means uplift rather than sideways pressure becomes the design case. Purlin clamps, tensioned roof edges and an anchoring plan sized for exposed sand or decking are what keep an open sided tent in place when a coastal gust arrives.

Key Features and Selling Points

- **Uplift resistant roof:** Purlin clamps and tensioned roof edges are specified for open structures where wind passes beneath the canopy.
- **Shade without enclosure:** A single roof layer cuts direct sun while leaving the horizon and airflow completely open.
- **Sand and deck anchoring:** Ground screws, sand anchors and deck plates cover the surfaces beach clubs actually stand on.
- **Optional partial walls:** One or two wall panels can be added for windward shelter without closing the venue off.
- **Bar and counter integration:** Wall openings can be positioned to create service counters facing the beach promenade.
- **Fast seasonal install:** Designed to go up before the season and come down at the end without heavy equipment.

Technical Specifications

Parameter	Specification
Roof	Single layer shade roof, uplift rated
Walls	Open or partially walled
Anchoring	Ground screw, sand anchor, deck plate
Service	Counter openings on request
Frame material	Hard-pressed extruded aluminum alloy 6061/T6, anodized finish
Frame profile series	64 mm / 82 mm / 100 mm / 120 mm square profiles by span
Bay spacing	3 m / 4 m / 5 m modular bays, extendable at any time
Eave height options	2.5 m to 4 m clear height, higher on request
Roof fabric	650 g / 750 g / 850 g per sqm double PVC-coated polyester, blackout available
Side wall options	Solid PVC, clear PVC, glass panel, mesh, glass door, ABS hard wall
Fire performance	Fabric meeting DIN 4102 B1 / EN 13501 B-s1,d0 on request
Wind load guidance	Engineered configuration by site exposure, documented operating limits
Snow load guidance	Steeper pitch and reduced purlin spacing for snow regions
Temperature range	-30 C to +70 C service range for fabric and frame
Design life	15 years frame, 8 to 10 years fabric under normal use
Warranty	5 years on aluminum frame structure, 2 years on PVC fabric

All values are configuration dependent. Final specifications are confirmed on the approved drawing before production.

Clear Span, Transparent Roof or Solid Wall

The three common configurations are compared below. Most Croatian projects combine two of them on one frame, for example glass facing the sea and insulated solid walls facing the windward side.

Configuration	Exposure grade	Main advantage	Photography	Best suited to
Clear span with solid PVC walls	A	Full weather protection, lowest cost per sqm	Clean but featureless	Dinners, winter functions, storage
Clear span with clear or glass walls	A+	Protection with uninterrupted view	Excellent, low reflection	Seaside receptions, terraces, marina bars
Transparent roof with solid walls	A+	Sky visible, walls shelter wind	Strong at dusk, hot at midday	Evening ceremonies, sunset dinners
Open sided with shade roof	B	Maximum airflow, no rain protection	Bright and airy	Beach clubs, day bars, summer lounges

Buy or Hire: A Decision Table

Route	Typical user	Trade off
Buy	Recurring events, seasonal terraces, rental fleets	Own asset, no repeat fees, custom branding
Hire locally	One off events with no storage or crew	Low upfront cost, limited configuration choice
Buy with seasonal resale	Growing event businesses	Asset value retained, aluminum recyclable

Configuration Guide for Croatian Buyers

Use the table below to match the structure to your site exposure and event type. Our engineers confirm the final configuration against photographs of the ground, the prevailing wind direction and the event duration.

Duty level	Typical use	Recommended build
Light duty	Garden parties, short events, sheltered inland sites	64 mm profile, alternate bay bracing
Standard duty	Weddings, corporate functions, coastal towns in summer	82 mm profile, cross-braced bays, mixed walls
Heavy duty	Exposed coast, island venues, public events, winter use	100-120 mm profile, full bracing, engineered anchors

Applications

Beach clubs, seaside bars, pool bars and resort day clubs use this structure for shaded seating, DJ positions, bar counters and lounger areas. It also suits beach wedding cocktail hours and sunset parties where guests move between the tent and the shoreline. Because walls are optional, the same frame covers a daytime bar and an evening party without a second structure.

Shade, Wind and Sand: Three Details That Matter

Sand is a poor anchor and a good thief of small fittings. We supply sand anchors and ground screws with the structure, and we recommend keeping a small box of spare pins and clamps on site, because a fitting lost in the sand at midnight is a fitting the crew will not find at sunrise. Deck installations use plates and ballast instead, with a load calculation for the timber or composite surface.

Wind is the second detail. An open sided roof behaves like an aerofoil in a gust, so we specify clamped purlins and tensioned edges, and we advise on when to lower side panels or close a windward bay. Beach club staff can manage this with a simple rule: if the sea is white-capped, drop the panels and check the anchors.

Why Croatian Event Buyers Work With Tendars

Seventeen years of export work has taught us that the difference between a good marquee and a frustrating one is usually invisible in a photograph: a seam that holds, a clamp that does not slip, a panel that still fits in year six. We build for that timeline rather than for the first season, which is why rental companies and hotel groups return for additional structures instead of replacing what they already own.

Our client base covers rental fleets, hotels, wedding planners, marinas and municipal event departments, with deliveries into more than 60 countries and a growing presence in Croatia and neighbouring Adriatic markets. That spread matters practically, because it means a specification tested in coastal salt air, inland snow and festival dust has already met the conditions a new buyer is worried about.

Service continues after delivery. Spare panels, legs, beams, fittings and profile sections remain available for the life of the structure, and our team can review photographs of a damaged part and confirm within a day whether it can be repaired on site or must be replaced. For larger projects a supervisor can attend the first installation so the crew learns the sequence correctly from the start. For summer beach club service, the drawing set we issue reflects that specific use rather than a generic template.

Notes for the Croatian Market

Croatian buyers tend to compare three things before price: whether the frame will survive a bora season, whether the fabric will still look white after a summer of sun, and whether spare parts can be delivered before the next event. Our proposals answer those questions in writing, with anchoring options by ground type, UV stabilised fabric specifications and a clear statement of what is held in stock.

Seasonality drives the calendar as well. Most installations happen between April and June, and most removals between October and November, which puts pressure on factory lead times in spring. Buyers who confirm drawings in winter typically secure their delivery slot before the spring rush, and we plan mixed container loading so several configurations can ship together without wasting volume.

Frequently Asked Questions

- **How is wind resistance confirmed for a specific site?** We review photographs of the ground, surrounding buildings and prevailing wind direction, then issue a configuration with written operating limits. Where a site is fully exposed we specify heavier profiles, continuous bracing and anchoring suited to rock or thin soil instead of garden stakes.
- **Which documents come with the shipment?** Shop drawings, a packing list matched to crate labels, an installation sequence, a maintenance sheet and, where required, fabric fire certification and test reports. These are the documents venues and inspections normally ask for, so they travel with the goods rather than arriving later.
- **Can one frame be used for summer and winter events?** Yes. The frame is the durable part, so we supply interchangeable skins: open or mesh walls with a shade roof for summer, solid insulated walls with liners and heating ports for winter. Storage is then limited to the panels not currently in use.

Packaging and Quality Assurance

Frames are packed in bundles by assembly order, fabric panels are folded with protective interleaving, and small fittings travel in labelled crates that match the packing list. Loading is planned for mixed containers so that several configurations can ship together without wasting volume. Each shipment includes shop drawings, a packing list, an installation sequence and a maintenance sheet covering cleaning, storage and small repairs.

Before dispatch we trial assemble the frame, check every welded panel for leaks, and photograph the packed goods. If anything arrives damaged in transit, replacement parts are shipped from stock rather than waiting for a new production run. Shipments for summer beach club service are labelled accordingly, so the receiving crew can match crates to the drawing on arrival.

Request a Quotation

Send us your site location, expected guest numbers, event dates and ground surface, and we will return a configuration proposal with anchoring options, installation guidance and a delivered price to your Croatian port or site. Samples of fabric and frame profiles can be couriered on request.
